

TT288 – January 30, 2007

P&A Accessory Wheels

There have been some changes to the Instruction Sheets for the Front Thunderstar and Front Road Winder Wheels. A summary of the changes and I-sheet numbers are below.

-J04065: Front Thunderstar Wheels: More clearly defines the installation of Kits 43975-07, 43773-07, and 43602-07. This addresses the installation of wheels on a 2007-later FX Softail, where the left side of the wheel is the primary bearing side.

-J04063: Front Road Winder Wheels: Correctly identifies the Installation Kit (43851-07) to use for Kit 41406-07 in Service Parts Table 2.

NOTE: The Primary bearing is pressed into the hub first and will bottom out in the bearing bore. Then you install the bearing sleeve spacer from the opposite side and press in the secondary bearing until it bottoms out on the bearing sleeve spacer, not the secondary bearing bore. You will see a gap between the secondary bearing and secondary bearing bore, this is more noticable when using the 25mm bearings and is normal.

The updated I-sheets are available on h-dnet and should be used when installing these wheels. Please inform all Service and Parts Personel of these changes.
